Explanation:

Document 2 describes that (1) if the surface speed of a substrate is made faster than the rotating speed of a roll by 5 to 20% when a coating solution showing Newtonian flow or having thixotropy during coating is applied, the roll slips on the surface of the substrate, and (2) as a result, even a solution poor in leveling can be applied uniformly. Document 3 describes that for smoothly applying a highly thixotropic paint, the deceleration rate is set at 10 to 25%. However, neither of them promotes its application to the coating of hot melt adhesives whose coating solutions have different properties.

Therefore, the subject matters of claims 1-14 appear to be novel and to involve an inventive step.
